EXPERIENCE

Amazon Web Services (AWS)

Toronto, ON

Software Development Engineer I, RDS Team

Jan 2025 – Jan 2026

- Engineered a load-testing framework prototype designed to target **10,000+ TPS** for a distributed telemetry service; instrumented **ECS task health** and **CPU** monitoring to identify theoretical bottlenecks.
- Architected the core business logic for a synchronous instance configuration API, modeling state persistence in **DynamoDB** and defining **CloudWatch** observability patterns for RDS infrastructure.
- Supported on-call for a metrics ingestion service; triaged and resolved **25+** production incidents, executed mitigations via runbooks, and delivered follow-up fixes to prevent recurrence.
- Remediated stale **CloudFormation** deployments across **60+** AWS accounts by auditing stacks, removing failed/obsolete resources, and safely re-deploying to restore consistent infrastructure.
- Refactored **CloudWatch** dashboards to stay within service limits and automated KPI extraction for Monthly Business Reviews, reducing manual reporting overhead.

Tangerine Bank

Toronto, ON

Software Developer Intern

Apr 2020 – Aug 2020; Apr 2021 – Aug 2021

- Developed scalable Java components in a high-traffic web application, improving performance.
- Refactored SQL queries and optimized indexing to reduce latency and improve page-load times.
- Reduced deployment errors by **20%** by optimizing **Docker** configurations and supporting **Kubernetes** deployments.
- Reduced build errors by **50%** by automating Maven build tasks, improving CI reliability.

PROJECTS

On-Call Debugging Assistant (Internal Hackathon – AWS RDS Toronto)

AWS Lambda, Web App

- Built an internal web tool where engineers paste a ticket link/ID to launch guided Q&A troubleshooting flows backed by **3** diagnostic playbooks, outputting actionable debugging checks and mitigations.
- Won **1st place** in a 3-day AWS RDS Toronto team hackathon for improving overnight incident triage speed and consistency.

Ascend – Accountability Tracker

React, Node.js, AWS (Lambda, DynamoDB, API Gateway, CDK), Vercel

- Architected a serverless full-stack productivity tracker with **API Gateway + Lambda** and a DynamoDB schema designed around explicit access patterns (Query + sort-key prefixes) for timeline-based retrieval.
- Implemented request validation and structured JSON logging (requestId/latency/error paths) plus targeted unit tests for shared API utilities to improve debuggability and reduce regressions.
- Built an OAuth-based email ingestion workflow with backend-only processing to extract/import metadata; isolated secrets and enforced least-privilege access for external integrations.
- Developed a serverless proxy on Vercel to query the LeetCode GraphQL API with a **5-minute** CDN cache and local state to display live statistics reliably.

TECHNICAL SKILLS

Languages: Java, Kotlin, SQL, Python, JavaScript/TypeScript.

Frameworks & Tools: Spring Boot, React, Node.js, AWS CDK, REST & GraphQL APIs.

Cloud (AWS): RDS, DynamoDB, Lambda, API Gateway, ECS, CloudFormation, CloudWatch.

DevOps & Infra: Docker, Kubernetes, Linux/Unix, CI/CD.

EDUCATION

York University

Toronto, ON

Bachelor of Science Honours in Computer Science

Class of 2024
